

## Why Georgetown Pulmonary and Critical Care?

1. Small, close-knit fellowship program with lots of opportunities for mentorship. We love our co-fellows and faculty!
2. First years spend July in a pre-fellowship bootcamp, and then start on service in August. (July is completely protected: NO call or service obligations.) Bootcamp is run jointly with other nearby critical care programs. It consists of a mix of small groups, lectures, and simulations covering the full spectrum of critical care: ventilators, procedures, ultrasound and radiology, physiology, and more!
3. Clinically oriented and procedurally heavy fellowship. We have a busy interventional pulmonary service without an advanced interventional pulmonary fellow. The general pulmonary fellows do ALL basic and advanced pulmonary procedures.
4. We own airway: from intubation to performing our own percutaneous tracheostomies.
5. Large departmental presence in the hospital. Our department is generally first call for chest tubes, biopsies of new lung nodules, and workup of pulmonary hypertension (we do our own right heart catheterizations).
6. Busy, high acuity MICU with excellent nursing staff. We take care of very sick patients with graded autonomy as fellows.
7. Busy, varied clinic with sub-subspecialized attendings spanning the breadth of pulmonary medicine.
8. An educationally focused rounding structure. This provides great opportunities to hone teaching skills with residents and medical students. Fellows run teaching rounds and resident didactics, as well as supervise procedures.
9. Research opportunities including large internal clinical databases and ongoing clinical trials. Alternatively, you can fulfill your research obligation by participating in quality improvement on a hospital committee or developing an independent project.
10. Amazing location in Washington, DC! A perfectly sized city with great restaurants, free museums, fun neighborhoods, and beautiful outdoor spaces.
